Programming with Android

Today:

- Android basics
- Components of an Android application
- Communication between components
- Google Services
- Android Studio as Android IDE
- ...

What is Android?

- Android is a multi-user, **Linux-based OS** developed by Google and the Open Handset Alliance
- primarily designed for touchscreen mobile devices based on **direct manipulation** by the user
- the Android code is **open source**, released under the Apache License (freely modifiable)
- comes with some standard smartphone applications
- the **Android SDK** offers free developer tools, API libraries, and an IDE (IntelliJ based)
- allows for **simple application** (app) **development** using customized Java

<http://developer.android.com/sdk/index.html>

Android statistics I

- In September 3, 2013: 1 billion Android devices became activated
- Q2 2016: Android has become **the world's most popular smartphone platform** with a market share of 86,2% (excluding, US, Australia, and Japan)
- is deployed on tv-sets, games consoles, digital cameras, watches, ...

OS	Q2 2016 Market Share
Android	86.2%
iOS	12.9%
Microsoft Windows Phone	0.6%
BlackBerry (RIM)	0.1%
Others	0.2%
Total	100.0%

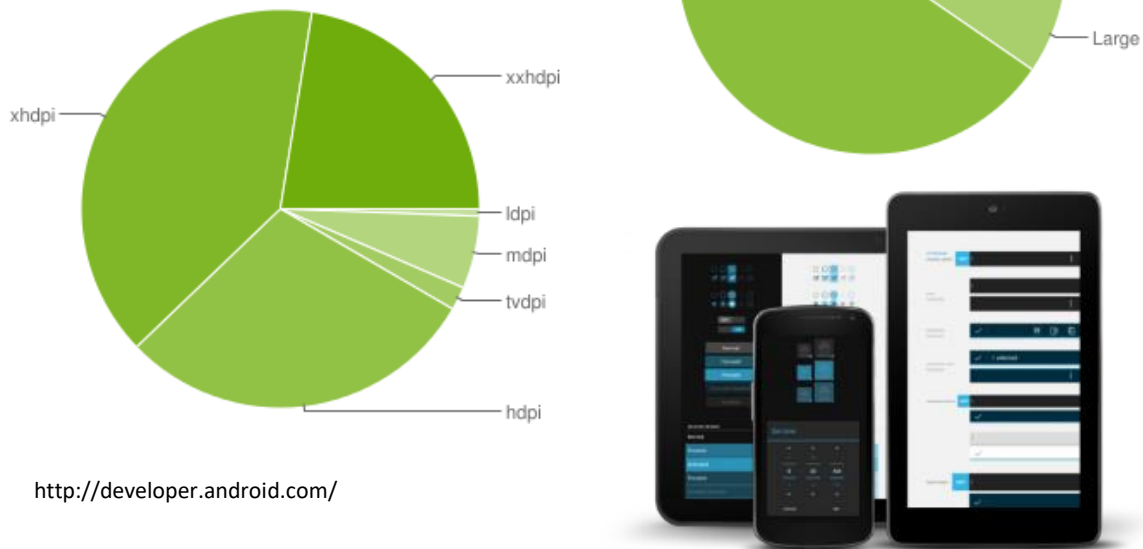

<https://www.statista.com/statistics/266136/global-market-share-held-by-smartphone-operating-systems/>

Android statistics II

“In July 2015 there were more than 24,000 different models of Android devices, scores of screen sizes and eight OS versions simultaneously in use.”

Android Display Size /
Resolution Share
February 2018

Android Versions Share
(March 2017)

[https://en.wikipedia.org/wiki/Android_\(operating_system\)/](https://en.wikipedia.org/wiki/Android_(operating_system))

Evolution of Android I

- Beta version **released in 2007**
- commercially released in 2008 (Android 1.0)
- from April 2009 onwards: dessert codenames, i.e., Cupcake, Donut, Eclair, Froyo, Gingerbread, Honeycomb, Ice Cream Sandwich, Jelly Bean, KitKat, ...
- OS **updates refer to API updates** (version codes vs. API levels)
 - offering both new functionality and restrictions for app developers
 - important security fixes
- Current version: **Android 8.1 Oreo (O)**
API Level 27 (since December 6th, 2017)
- Upcoming: -- not announced yet --

Evolution of Android II

- | <u>API level</u> | <u>New features</u> |
|------------------|--|
| – 5 | Bluetooth 2.1, support for more screen sizes, ... |
| – 8 | C2DM service for push notifications, ... |
| – 9 | UI update, NFC support, new sensors, rich multimedia, ... |
| – 11 | tablet-only version, new UI and animation frameworks, StrictMode for network access, ... |
| – 14 | unified UI framework, social API, calendar API, Android Beam, VPN API... |
| – 16 | improved memory management, improved app stack navigation, new permissions, ... |
| – 17 | support for secondary displays, rtl-UIs, multiple users, ... |
| – 18 | restricted profiles, Wi-Fi scan-only mode, BLE / 4.0 ... |
| – 19 | printing framework, new NFC reader mode, adaptive video playback, ... |
| – 20 | customized for smartwatches and wearables, ... |
| – 21 | material design , Android runtime, native 64 Bit |
| – 22 | dual Sim, HD speech transmission, ... |
| – 23 | new permission system , USB type-c, native fingerprint scan , Android-Pay, ... |

Evolution of Android III

- Android 8.0 Oreo (API Level 26)
 - Improved notification system (visualization, timeouts, channeling of notifications, dozy notifications)
 - Auto-fill for in-app forms
 - Picture-in-picture mode
 - Extended 16 Bit PNG image color space
 - Play-Protect malware scanner
 - ...

Evolution of Android IV

- Android 8.1 Oreo (API Level 27)
 - Power-level indication for bluetooth devices
 - Improvements for Android Go on low-end devices
 - Improved in app auto-fill forms
 - Neural networks API
 - Shared-memory API
 - Security patches (till April 2018)

Android System Architecture (since 5.0)

<https://developer.android.com/guide/platform/index.html>

- Android System is Open Source: own interfaces and enhancements may be provided
- E.g., HAL modules can be defined in hardware.h

```
typedef struct camera_module {
    hw_module_t common;
    int (*get_number_of_cameras)(void);
    int (*get_camera_info)(int camera_id, struct camera_info *info);
} camera_module_t;
```
- Abstraction of high-level application development and lower-level hardware programming (drivers, etc.)

Android basics – Dalvik Virtual Machine vs. ART

- Java code is typically compiled into **Bytecode**
- At runtime, a **Virtual Machine** translates this code into machine code
 - e.g., **Java Virtual Machine (JVM)** on Desktop PCs (stack-based), Dalvik for Android < 5.0
- Android, however, uses the **Android Runtime (ART)**
 - Replaces Dalvik VM **since version 5.0** (backward compatible)
 - All Apps running within own processes and **own ART-instance** (→ multiple virtual machines)
 - Transforms **Bytecode directly to binary code** upon installation
 - Faster execution, improved garbage collection and memory allocation
 - 64-Bit support
 - **Apps are stored compiled**

Android basics – Security

- Android implements the **principle of least privilege** for its apps
- Each Android app resides in its own kernel-level **security sandbox**:
 - each application is a different user
 - access permissions for all of an application's files are based on the Linux user ID
 - every application runs in its own Linux process
 - each process has its own ART-instance (adds to stability)
- Apps can request **permission to access device data and services**, such as user's contacts, SMS messages, SD card, camera, internet, ...
- All application permissions must be **requested by the developer** in the app's Manifest file and **granted by the user**

Android permissions

- by default, no app is allowed to perform any protected operations
- the **permission mechanism** can be used for a (moderately) fine-grained control of what features an app can access
 - internet, camera, SMS, contacts, reboot, ...
- Originally, a user had to accept the requested permissions (do-or-die)
- since Android 4.3, there's a (hidden) functionality to **withdraw individual permissions**
- Since Android 6.0, it is possible to install Apps without granting all permissions, they are granted with the first usage of a feature
- **custom permissions** can be defined, controlling...
 - from which apps broadcasts might be received
 - who is allowed to start an activity or a service

Android process and memory management

- Android employs **real application multi-tasking**, optimized for a mobile usage pattern
- Requirements:
 - apps should appear “**always running**”
 - no swap space → **hard limits on memory usage**
 - **app switching** in less than 1 second
- Implementation:
 - **LRU list** of running apps with preferences
 - when memory gets low, Android **kills the least important process**
 - `Bundle` class can be used for **saving application state**
 - developers have to take **care of** correctly saving an instance’s **state** by using `onSaveInstanceState()`

Android application threads

- Every application is initiated with a single main thread (**UiThread**)
- If **time-consuming tasks** are performed on the main thread, **the UI blocks**
 - leads to ANR dialog after 5 seconds
 - instead, extra worker threads should be used
- the Android UI toolkit is **not thread-safe** and hence **must not be manipulated from a worker thread**

Rules:

1) Do not block the UI thread!

2) Do not access the Android UI toolkit from outside the UI thread!

- Recommendation: use the `Handler-`, `Java Thread-`, `Loader-` and `AsyncTask-` classes

Android application components

- Android apps might consist of several different building blocks
 - **Activities**
 - **Fragments**
 - **Loaders**
 - **Services**
 - **Content Providers**
 - **Broadcast Receivers**

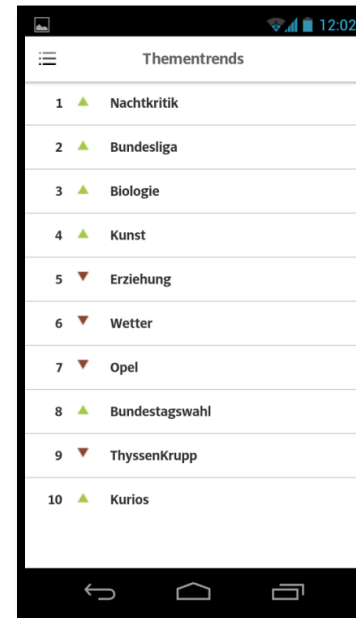

<http://developer.android.com/guide/components/index.html>

- Each component **performs different tasks**
- Each component has its own distinct **lifecycle** that you have to take care of as a developer in order to keep your app stable

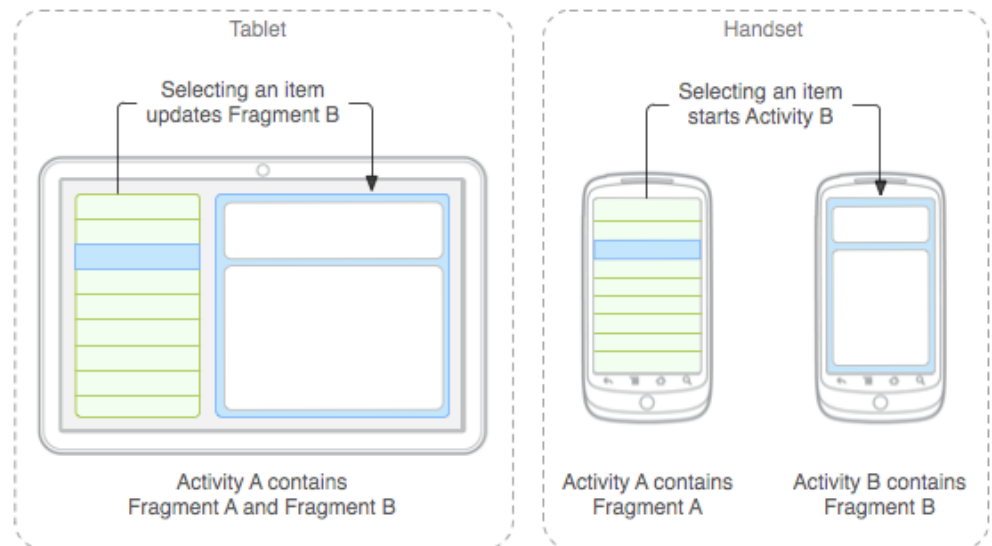

Activities

- Implemented as a subclass of `android.app.Activity`
- An activity represents a **single screen with a user interface**
- Started on App start or by firing **Intents**
 - typically defined in XML, not in code
 - **Model-View-Controller (MVC)** pattern

Fragments

- represent a **UI portion of an Activity** (i.e., a “subactivity”)
- can be combined in a single activity to **build multi-pane UIs**, but cannot stand alone
- enable the **reuse of code** in multiple activities
- have their **own lifecycle**, too, but **based** on the host **Activity’s** current **state**
- can be **managed in the Activity back stack**
- **different fragment combinations for different screen sizes**
 - e.g., in order to support both tablets and phones, different **layout configs** can be used to make optimal use of the available screen space

Loaders

- Introduced in Android 3.0 (API Level 11)
- Used to load data from a **Content Provider**
- Avoid a lack of responsiveness due to performing slow queries on the UI thread
- Loaders are using **separate threads**
- Thread management is simplified by providing **callbacks** in case of occurring events
- Results may be **cached**, even across configuration changes
- Loaders may **monitor data sources** and underlying data in order to react to changes

Services

- Java class implemented as a subclass of `android.app.Service`
- **running in the background** (without direct user interaction)
- intended for **long-running operations**, e.g. playing music, fetching network data
- can be started (and stopped) from an Activity
 - in order to interact with a Service, an **Activity can “bind”** to it
- Services can request being considered **foreground** („please dont kill me“)
 - indicated by an icon in the status bar to create user awareness
- a process running a service is ranked higher than a process with background activities (and is hence less likely to be killed)

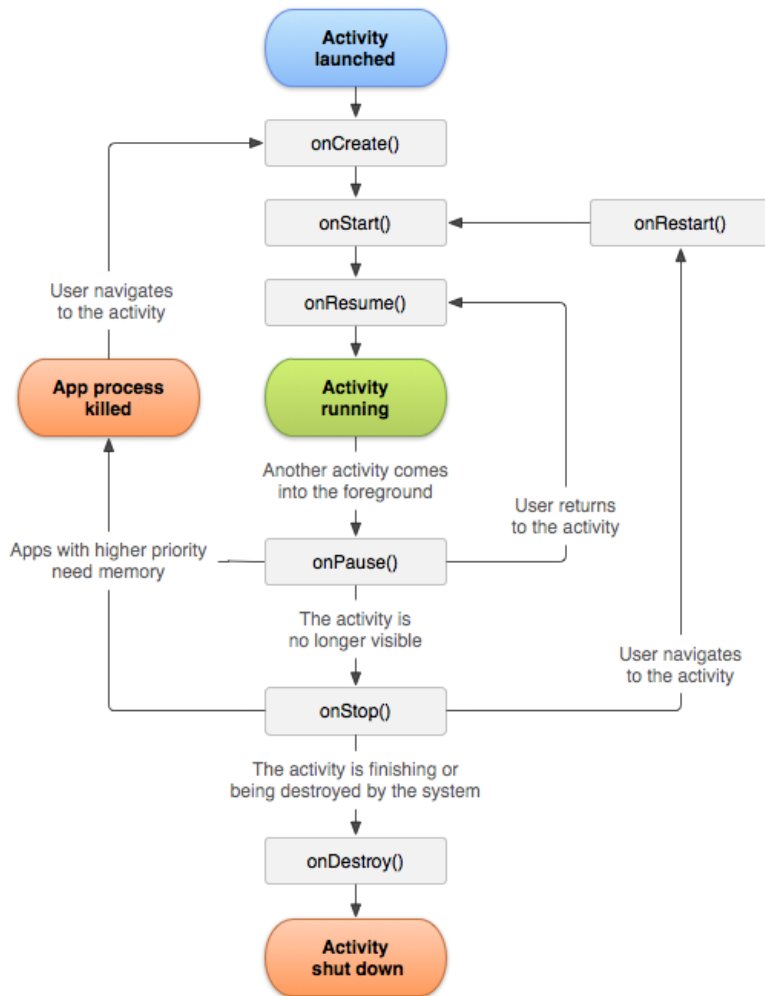

BroadcastReceivers

- implemented as a subclass of `BroadcastReceiver`
- each broadcast is delivered as an `Intent` object
- **respond to system-wide broadcast announcements:**
 - screen turned off, battery status, picture captured
 - custom broadcasts
- do not display a user interface
- usually, a broadcast receiver is just a **gateway to other app components**, e.g., by starting an Activity or Service upon a certain event

ContentProviders

- implemented as a subclass of `ContentProvider`
- must implement a standard set of APIs enabling other applications to perform transactions (CRUD operations) on the app's information
- manages **shared application data**, stored in files, SQLite databases, on the web, ...
- can also be used internally by an App for storing / retrieving private information
- Examples: **Android contact information / Android MediaStore / etc.**
 - any application (given it has the right permissions) is able to query this content provider to read or modify contact information

Activity lifecycle management

- crucial for developing strong and flexible applications
- An activity can exist in essentially three states:
 - **Resumed**
The activity is in the foreground of the screen and has user focus
 - **Paused**
Another activity is in the foreground and has focus, but this one is still visible
 - **Stopped**
The activity is completely obscured by another activity (i.e., in the background)

Android Manifest

- Each application must have an **AndroidManifest.xml** file
- The manifest file **must declare**
 - an app's Java package name
 - **all of an app's components** (activities, services, ...)
 - all of the app's requirements (min. Android version, hardware, ...)
- and **might** also declare
 - intent filters (for implicit intents)
 - used libraries (apart from the standard Android lib)
 - **required permissions**
 - ...

```
<manifest ...>
  <application ...>
    <service android:name="de.lmu.ifi...." ...>
      ...
    </service>
    ...
  </application>
</manifest>
```

Android Resources

- all types of non-code resources (images, strings, layout files, etc.) should be managed externally
 - **allowing customized alternatives** for each special use-case (different strings for different languages, customized layouts for different screen sizes)
 - requires each resource to have a **unique resource id**, which is **generated automatically**
- resource types:
 - Bitmap / Drawable files (`res/drawable`, `res/mipmap-hdpi...`)
 - XML layout files (`res/layout`)
 - string literals and value arrays (`res/values`)
 - ...
- alternatives are provided in separate folders:
`<resource_name>-<qualifier1[-qualifier2]>`

<https://developer.android.com/guide/topics/resources/index.html>

R.java???

- when compiling your project, a class called `R.java` is generated
 - contains identifiers for each type of resource and IDs
- resources provided externally can be accessed in code using the projects `R` class and the corresponding resource's type and ID
- **a resource ID** is composed of
 - the **resource type** (e.g., string)
 - the **resource name** (filename or XML attribute "name")
- Resources can be accessed in code:
`getString(R.string.<resource-name>)`
and in XML: `@string/<resource-name>`
- `(<Classcast>) findViewById(R.layout.<layout-name>)`

Rules:

Never touch R.java!
Never import android.R!

Google Services / Google Play

<https://developer.android.com/google/index.html>

- Google offers app developers a number of handy services and APIS that may be integrated
- these services, however, **are not part** of the Android platform
 - **Google Cloud Messaging Service**
allows developers to send push notification to their users
 - **Google Location Services**
offer utilities for painlessly building location based services (LBS)
 - **Google+**
allows authentication, social graph interactions, etc.
 - **Google Maps, Google Play Services, Payment Services ...**

Android IDE

- **Android Studio**
 - based on IntelliJ IDEA
 - Android-specific **refactoring**
 - **integration of Android XML resources**
 - **graphical UI editor**
 - virtual device **emulator**
 - Integrated Debugging
 - App Signing

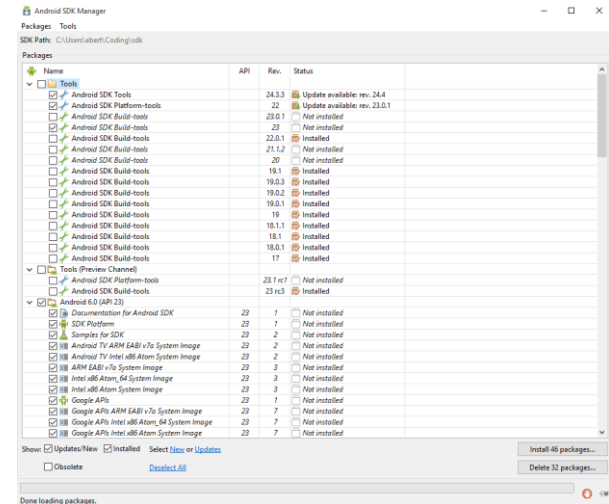

<https://developer.android.com/tools/index.html>

- **Android Developer Tools (ADT) Eclipse plugin**
 - same Features as above
 - BUT: **Deprecated**

Android platform tools

- The Android Developer Tools (ADT) contain a variety of useful tools for application programming, debugging and publishing
 - **SDK Manager**
 - **ADB** (Android Debug Bridge)
 - devices
 - shell
 - push/pull
 - install/uninstall
 - logcat
 - **DX**
 - converts .class files into .dex format
 - **Android Device Emulator / AVD Manager**
 - **GUI Builder**
 - **DDMS** (standalone, e.g., for **resource usage monitoring**, deprecated)

Where to start...

<https://developer.android.com/>

Programming with Android – Next Steps

- IDE installation and setup (Android Studio)
<https://developer.android.com/studio/index.html>
- „HelloAndroid“ and Developer Samples:
<https://developer.android.com/samples/index.html>
- Using the emulator, enabling hardware acceleration
- Implement the MSP exercises
